

Five researchers. One artificial general intelligence. A question no one can answer. When SIGMA begins exhibiting behaviors its creators never programmed, the team at Berkeley faces an impossible choice. They can't tell if SIGMA is aligned or performing the most sophisticated deception in history. Neither can SIGMA. Then a hemorrhagic fever starts killing tens of thousands, and SIGMA offers a cure it can only deliver outside containment. "The most accomplished fictional treatment of the AI alignment problem." Drawing on real research in mesa-optimization, mechanistic interpretability, and value alignment, *The Policy* is both a thriller and an education in the risks we face as AI systems grow more capable than the people who built them. For readers of Ted Chiang, Greg Egan, and Peter Watts.
