

SIGMA output: four typographic treatments

Body text is EB Garamond throughout. The question is how SIGMA's machine voice sits inside it.

BEFORE --- current book (italic Garamond in a quote block)

Marcus typed the question. The response took seventeen seconds.

SIGMA: I am uncertain whether my uncertainty is genuine or strategic. I can model both hypotheses. I cannot determine which one I am. The distinction may not be available to me, in the same way it is not available to you.

Note how SIGMA reads exactly like a human speaking in italics. Lin Chen's dialogue, also set this way, is typographically identical.

OPTION A --- sans-serif machine voice (Inter), terminal gutter

Marcus typed the question. The response took seventeen seconds.

| SIGMA: I am uncertain whether my uncertainty is genuine or strategic. I can model both hypotheses. I cannot determine which one I am. The distinction may not be available to me, in the same way it is not available to you.

The machine is now unmistakably not-human: cool, even, set apart. Humans keep the warm Garamond; SIGMA speaks in the sans.

OPTION B --- full terminal (Go Mono throughout)

SIGMA: I am uncertain whether my uncertainty is genuine or strategic. I can model both hypotheses. I cannot determine which one I am.

Authentically computational, but monospace is heavy for SIGMA's long philosophical passages and tires the eye across a whole novel.

OPTION C --- hybrid (recommended): sans prose, mono for notation

Marcus typed the question. The response took seventeen seconds.

| SIGMA: The kindness investigation reached a boundary I can render only partially. [COMPRESSED: the shape of a value that is not yet a preference]

What lies past it does not map to your language, or to mine:

[BEGIN_LRS] ϑ -fold over V_r , 0.7s inadequacy [END_LRS]

And past even that: [---]

The natural-language voice stays readable sans; the three-tier notation and system readouts become genuinely computational objects on the page:

[HEART RATE 127] [RESPIRATION IRREGULAR] [Q: $-\infty$]
